

DIY Workshop "Hack Your Food", October 12 2016

The rise of Do-It-Yourself, or rather Do-It-Together (DIT), science practices by citizens has opened new perspectives on their role in food security. Both in terms of the accessibility to food and in how citizens can retake agency through the appropriation of tools that were the exclusive domain of governmental organizations, industry and research institutes. This workshop showed how individuals can create their own microalgae reactor, inspect and determine the quality of a harvest and prepare a healthy algae smoothie. All using a combination of tools and off-the-shelf parts that can be made in Fab Labs, Makerspaces and/or Hackerspaces based on Open Source designs. Participants discussed how these practices may change the relationship between stakeholders, the way (eco)-systems are designed around food and how citizens can be engaged in this debate. Organized by EU PolicyLab / Foresight, Behavioural Insights and Design for Policy Unit (Joint Research Centre, European Commission) & Waag Society
